

UI Lead Engineer

Experience Should be 5+

Job Responsibilities:

- Demonstrated leading capabilities in current work.
- Drive from Conceptualization to Deployment of products that are robust and can stand the test of time with increase in information volume and future changes in design.
- Be very data-driven in designing new features by extensively relying on usage patterns, bucket testing, A-B Testing, and a very deep understanding of the domain and customer objectives.
- Be a Guru at Visual Articulation & specialize in the art of conveying complex data stories in simple & powerful visual constructs
- Have a natural ability to understand the full tech stack, and be able to debug and drive right design decisions
- Work closely with designers & product managers to build things that are normally regarded as holy-grails in browser-based analytics applications
- Actively participate in design and code reviews to build robust applications and prototypes
- Guiding team members wherever and whenever needed.
- Ability to come up with Modular and Reusable components.
- Ability to continuously look for better innovations for all teams across **Ad2Pro**.

Must Have:

- You must be proficient in **Problem Solving and Data structures** since you got to find the best way of handling huge set of data.
- You must have strong understanding of semantic **HTML / HTML5, CSS / CSS3**.
- You must know the in and out of **Javascript** to design optimized and modular components which need to be used across our platform.
- You must have good understanding of **MVC architecture**. Hands-on in any one of **Angular2+, React or VUE**.
- You must have experience in setting up the full UI workflow layer right from Development, Testing, Building and Deployment.
- Experience in frameworks like Bootstrap, Foundation and CSS pre-processors like SASS and LESS is desirable
- Hands on **Node server**, Socket connections and mechanisms to handle real-time async data.
- Hands on of REST API.
